Stanford University
United States of America

To Whom It May Concern:

My name is Steve Boulton and I am a first year student at University of Rwanda. I am currently pursuing a four-year Bachelor of Engineering Degree, and I plan to follow up with a one-year master's degree after I graduate.

While in high school, I interned with a reputable chemical plant in the Research and Development department. I learned about the construction process of refineries from the ground up, and I discovered the importance of its function. I worked closely to develop and optimize the machinery to increase the output at the plant. Additionally, I volunteered at an NGO to design and implement new technologies in the water supply mechanism of the town.

My education is largely focused on this mindset: function over form, stability over showmanship. I have enrolled in several classes that amalgamates Chemical Sciences with Engineering in order to have a comprehensive view of how design meets structure. I have worked on four extra-credit chemical plant and oil refinery design projects under the supervision of my professors (Dr. A and Dr. B) to accelerate my research and education.

I believe in avoiding accidents rather than fixing the loss it causes. Thus, as an engineer, I want to create accessible, cost-effective, productive, and durable AI-based operational systems that inform us about the potential malfunctions in advance. Coming from a mechanical background, I believe that there is a need for an operational system that is reliable.

I appreciate your consideration. With your assistance, I can continue my schooling in engineering and design to put an end to uncalled-for accidents in plants and other industries.

Sincerely,

Steve Boulton
